Projects

- Variable Computation in Recurrent Neural Networks (2017)**
 - Modified a RNN model to make it learn to vary the amount of computation according to the sequence that they process.
 - Implemented a scheduler for the RNN unit which decides the computation required at the current timestep.
 - Reduced the number of operations for bit-level language modelling to around 50% compared to normal RNN unit.
- Microphone Signal Conditioning System (2017)**
 - Designed a signal conditioning circuit for a microphone using OPAMPS.
 - Utilised the condenser microphone as a capacitance in the RC Filter Circuit.
 - Interfaced the circuit with the computer using NI-DAQmx data acquisition card and interpreted noisy signals in LabVIEW.
- Finite Impulse Response filter design using an adjustable window filter (2017)**
 - Implemented an adjustable window function based on the combination of Blackman and Lanczos window.
 - Achieved a 75% better side-lobe roll off ratio than Lanczos window.
 - Denoised an ECG Signal using this filter.
